TEN (10) SCREENING TESTS FOR MEN

Are you one of those guys who can't remember the last time you stepped foot in a doctor's office? Sure, maybe you've gone in for something urgent. But what about scheduling an annual exam or screening test? Maybe you simply forget, think you already have healthy habits, or insist that you "feel just fine." Sorry, guys ... not quite good enough.

Regular checkups and screening tests aren't something you can afford to ignore. Baseline tests can help your doctor know how your health is changing over time. Plus, silent killers such as prostate cancer, high blood pressure or high cholesterol can wreak havoc – and you wouldn't have a clue without being tested.

Here's a simple screening cheat sheet to make your life easier.

1) ABDOMINAL AORTIC ANEURYSM:

If you have ever smoked, get this ultrasound test one time between the ages of 65 and 75. This test will show whether or not your largest artery, the abdominal aorta, is bulging. If it is, it may burst, putting you at risk for bleeding – and even death.

2) BLOOD PRESSURE:

Starting at age 18:

- a) Get tested at least every 2 years if your blood pressure is lower than 120/80.
- b) Get tested once a year if your blood pressure is between 120/80 and 139/89.
- c) Discuss treatment options with your doctor if your blood pressure is 140/90 or higher.

3) CHOLESTEROL:

From age 20 to 34, get a regular cholesterol test if you are at increased risk for heart disease. At age 35, get a regular cholesterol test. Ask your doctor how often you need to do this.

4) PROSTATE CANCER:

Get screened for prostate cancer from age 50. Prostate cancers are usually slow growing but some might grow relatively fast. They can cause problems like difficulty urinating, blood in the urine, or pain in the rectum or back. Your doctor may request one of several tests like prostate

GLOBAL HEALTH **PHARMACY**

surface antigen test (PSA), or digital rectal exams (DRE). Ask your doctor which test is best for you and how often you might have to do this.

5) COLORECTAL CANCER:

Get screened for colorectal cancer from age 50 to 75. This screening may include one or more tests, such as fecal occult blood testing, sigmoidoscopy, or colonoscopy. Ask your doctor which test is best for you and how often you need it.

6) DEPRESSION:

Ask your doctor about being screened for depression if over the past weeks:

- a) You have felt sad or hopeless
- b) You have lost interest or pleasure in doing the things you normally enjoy

7) DIABETES:

Starting at age 18, get screened if your blood pressure is high than 135/80 or if you take high blood pressure medicine.

8) HEPATITIS C VIRUS (HCR):

Get screened once if you:

- a) Were born between 1945 and 1965
- b) Have ever injected drugs
- c) Received a blood transfusion before 1992

9) LUNG CANCER:

Ask your doctor whether or not to be screened if you:

- a) Are between 55and 80.
- b) Have a 30 pack-year smoking history. This is the number of packs smoked per day times the number of years you smoked.
- c) Smoke now or quit within the past 15 years.

10) OVERWEIGHT AND OBESITY:

This is a test you can do yourself. Find your body mass index (BMI) by entering your weight and height into an online BMI calculator.

Discuss with your doctor whether you are at increased risk for any other disease, if so, you may need other tests. Be honest with your health care provider and your Global Health Pharmacist. Be sure to let a Global Health Pharmacist know what worries you – whether it's your weight, alcohol use, or challenges with anxiety. Think of your Global Health Pharmacist as your partner. Remember, "Your health is our
